Coleman / American Mineralogist / Vol. 66, No. 8, September. Sogou. Download page. The Klein method is the most suitable technique. but its not very common. Free download! Physical Mineralogy is part of the University of Michigan library - MINERALOGIA KLEIN. Adsorption of selected triazine herbicides to soils and sediments. The adsorption of the triazine herbicides atrazine (ATZ), prometryne (PRO), simazine (SIM), and terbumeton (TEB) was studied in eight different soil and sediment samples. All four compounds were found to adsorb strongly to soils and sediments, and the adsorption to the soils was found to be very strong, ranging from 40.5 to 80.8% for TEB, from 9.3 to 15.7% for SIM, and from 0.7 to 3.3% for PRO and ATZ. The amount of herbicide adsorbed was correlated with the pH value in the soils and sediments, with the total organic matter content, and with the clay content. The adsorption to the soils was studied using the Freundlich isotherm, and for most soils the isotherms were better described by the Langmuir isotherm. The slope for the Langmuir isotherm was always higher than 1, which indicated that the adsorption was favored by an electrostatic attraction. In the soils, the adsorption of all four herbicides followed the order TEB>SIM>PRO>ATZ. In the sediment samples, where the adsorption of these herbicides was about one order of magnitude lower, SIM was always
